

Second Activity

Sept. 16, 2010

Open the votes spreadsheet in its current form (`Class5Starter.xlsx`) and make *it* work with indirection as well, so that the user of the spreadsheet can pick a senator, X, and you'll produce a list of all senators and their X-ness. You need not actually *sort* this list from largest to smallest. The spreadsheet has a drop-down list that lets you pick the senator you want. The comment box near this describes how it got created.
