

Project 4

- What influences the accuracy of recognition systems?
 - Data
 - Representation
 - Learning

Project 4 – Data

- It has been claimed that Viola-Jones is successful because it is the first massively data-driven computer vision algorithm.
- You have several thousand positive examples and several million negative examples. How do you make use of them?

Project 4 - Representation

- Patches?
- Normalized Patches?
- SIFT descriptor?
- HoG descriptor?
- Multiple overlapping descriptors?

Matching with filters

- Goal: find I in image
- Method 0: filter the image with eye patch $h[m,n] = \sum g[k,l] f[m+k,n+l]$

f = image g = filter

What went wrong?

Filtered Image

Matching with filters

- Goal: find I in image
- Method 1: filter the image with zero-mean eye $h[m,n] = \sum_{i,j} (f[k,l] - \bar{f}) \underbrace{(g[m+k,n+l])}_{\text{mean of f}}$

Input

Filtered Image (scaled)

Thresholded Image

Project 4 - Learning

• Linear vs non-linear classifier

 What does the face vs non-face distribution look like?

Project 4 - Learning

Project 4 – Additional Concerns

- Learning parameters
- Training error
- Increasing average precision
- Increasing speed

Feature Tracking and Optical Flow

Computer Vision CS 143, Brown

James Hays

Many slides adapted from Derek Hoeim, Lana Lazebnik, Silvio Saverse, who in turn adapted slides from Steve Seitz, Rick Szeliski, Martial Hebert, Mark Pollefeys, and others

Last Course Section

- Recognition
 - Bag of words models
 - Interest points
 - Instance level recognition
 - Sliding window detectors
 - Geometry recognition / context

This class: recovering motion

- Feature-tracking
 - Extract visual features (corners, textured areas) and "track" them over multiple frames
- Optical flow
 - Recover image motion at each pixel from spatio-temporal image brightness variations (optical flow)

Two problems, one registration method

B. Lucas and T. Kanade. <u>An iterative image registration technique with an application to</u> <u>stereo vision.</u> In *Proceedings of the International Joint Conference on Artificial Intelligence*, pp. 674–679, 1981.

Feature tracking

- Many problems, such as structure from motion require matching points
- If motion is small, tracking is an easy way to get them

Feature tracking

- Challenges
 - Figure out which features can be tracked
 - Efficiently track across frames
 - Some points may change appearance over time (e.g., due to rotation, moving into shadows, etc.)
 - Drift: small errors can accumulate as appearance model is updated
 - Points may appear or disappear: need to be able to add/delete tracked points

Feature tracking

- Given two subsequent frames, estimate the point translation
- Key assumptions of Lucas-Kanade Tracker
 - Brightness constancy: projection of the same point looks the same in every frame
 - Small motion: points do not move very far
 - Spatial coherence: points move like their neighbors

The brightness constancy constraint

• Brightness Constancy Equation:

$$I(x, y, t) = I(x + u, y + v, t + 1)$$

Take Taylor expansion of I(x+u, y+v, t+1) at (x,y,t) to linearize the right side:

Image derivative along x Difference over frames

$$I(x+u, y+v, t+1) \approx I(x, y, t) + I_x \cdot u + I_y \cdot v + I_t$$

$$I(x+u, y+v, t+1) - I(x, y, t) = +I_x \cdot u + I_y \cdot v + I_t$$
Hence, $I_x \cdot u + I_y \cdot v + I_t \approx 0 \quad \rightarrow \nabla I \cdot [\mathbf{u} \quad \mathbf{v}_{-}^T + \mathbf{I}_t = 0$

How does this make sense?

$$\nabla I \cdot \mathbf{v}^T + I_t = 0$$

• What do the static image gradients have to do with motion estimation?

The brightness constancy constraint

Can we use this equation to recover image motion (u,v) at each pixel?

$$\nabla \mathbf{I} \cdot \mathbf{I} \cdot \mathbf{V}^{\mathsf{T}} + \mathbf{I}_{\mathsf{t}} = \mathbf{0}$$

• How many equations and unknowns per pixel?

•One equation (this is a scalar equation!), two unknowns (u,v)

The component of the motion perpendicular to the gradient (i.e., parallel to the edge) cannot be measured

If
$$(u, v)$$
 satisfies the equation,
so does $(u+u', v+v')$ if
 $\nabla I \cdot \mathbf{u}' \mathbf{v}'^{T} = 0$
 (u, v)
 (u', v')
 (u', v')

The aperture problem

Solving the ambiguity...

B. Lucas and T. Kanade. An iterative image registration technique with an application to stereo vision. In *Proceedings of the International Joint Conference on Artificial Intelligence*, pp. 674–679, 1981.

- How to get more equations for a pixel?
- Spatial coherence constraint
- Assume the pixel's neighbors have the same (u,v)

If we use a 5x5 window, that gives us 25 equations per pixel

$$0 = I_t(\mathbf{p_i}) + \nabla I(\mathbf{p_i}) \cdot [u \ v]$$

$$\begin{bmatrix} I_x(\mathbf{p_1}) & I_y(\mathbf{p_1}) \\ I_x(\mathbf{p_2}) & I_y(\mathbf{p_2}) \\ \vdots & \vdots \\ I_x(\mathbf{p_{25}}) & I_y(\mathbf{p_{25}}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = -\begin{bmatrix} I_t(\mathbf{p_1}) \\ I_t(\mathbf{p_2}) \\ \vdots \\ I_t(\mathbf{p_{25}}) \end{bmatrix}$$

Solving the ambiguity...

• Least squares problem:

$$\begin{bmatrix} I_x(\mathbf{p_1}) & I_y(\mathbf{p_1}) \\ I_x(\mathbf{p_2}) & I_y(\mathbf{p_2}) \\ \vdots & \vdots \\ I_x(\mathbf{p_{25}}) & I_y(\mathbf{p_{25}}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = -\begin{bmatrix} I_t(\mathbf{p_1}) \\ I_t(\mathbf{p_2}) \\ \vdots \\ I_t(\mathbf{p_{25}}) \end{bmatrix}$$

$$A \quad d = b$$

25x2 2x1 25x1

Matching patches across images

• Overconstrained linear system

$$\begin{bmatrix} I_x(\mathbf{p_1}) & I_y(\mathbf{p_1}) \\ I_x(\mathbf{p_2}) & I_y(\mathbf{p_2}) \\ \vdots & \vdots \\ I_x(\mathbf{p_{25}}) & I_y(\mathbf{p_{25}}) \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = -\begin{bmatrix} I_t(\mathbf{p_1}) \\ I_t(\mathbf{p_2}) \\ \vdots \\ I_t(\mathbf{p_{25}}) \end{bmatrix} A = b$$

$$25 \times 2 = 2 \times 1 = 25 \times 1$$

Least squares solution for *d* given by $(A^T A) d = A^T b$ $\begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = -\begin{bmatrix} \sum I_x I_t \\ \sum I_y I_t \end{bmatrix}$ $A^T A \qquad A^T b$

The summations are over all pixels in the K x K window

Conditions for solvability

Optimal (u, v) satisfies Lucas-Kanade equation $\begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = -\begin{bmatrix} \sum I_x I_t \\ \sum I_y I_t \end{bmatrix}$ $A^T A \qquad A^T b$

When is this solvable? I.e., what are good points to track?

- **A^TA** should be invertible
- A^TA should not be too small due to noise
 - eigenvalues λ_1 and λ_2 of **A^TA** should not be too small
- **A^TA** should be well-conditioned

 $-\lambda_1/\lambda_2$ should not be too large (λ_1 = larger eigenvalue)

Does this remind you of anything?

Criteria for Harris corner detector

Low-texture region

Edge

High-texture region

The aperture problem resolved

The aperture problem resolved

Dealing with larger movements: Iterative refinement

- 1. Initialize (x',y') = (x,y)
- 2. Compute (u,v) by

$$\begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = -\begin{bmatrix} \sum I_x I_t \\ \sum I_y I_t \end{bmatrix}$$

moment matrix for feature

2nd moment matrix for feature patch in first image

displacement

 $I_t = I(x', y', t+1) - I(x, y, t)$

- 3. Shift window by (u, v): x' = x' + u; y' = y' + v;
- 4. Recalculate I_t
- 5. Repeat steps 2-4 until small change
 - Use interpolation for subpixel values

Dealing with larger movements: coarse-tofine registration

Shi-Tomasi feature tracker

- Find good features using eigenvalues of second-moment matrix (e.g., Harris detector or threshold on the smallest eigenvalue)
 - Key idea: "good" features to track are the ones whose motion can be estimated reliably
- Track from frame to frame with Lucas-Kanade
 - This amounts to assuming a translation model for frame-toframe feature movement
- Check consistency of tracks by *affine* registration to the first observed instance of the feature
 - Affine model is more accurate for larger displacements
 - Comparing to the first frame helps to minimize drift

J. Shi and C. Tomasi. <u>Good Features to Track</u>. CVPR 1994.

Tracking example

Figure 1: Three frame details from Woody Allen's *Manhattan*. The details are from the 1st, 11th, and 21st frames of a subsequence from the movie.

Figure 2: The traffic sign windows from frames 1,6,11,16,21 as tracked (top), and warped by the computed deformation matrices (bottom).

J. Shi and C. Tomasi. Good Features to Track. CVPR 1994.

Summary of KLT tracking

- Find a good point to track (harris corner)
- Use intensity second moment matrix and difference across frames to find displacement
- Iterate and use coarse-to-fine search to deal with larger movements
- When creating long tracks, check appearance of registered patch against appearance of initial patch to find points that have drifted

Implementation issues

- Window size
 - Small window more sensitive to noise and may miss larger motions (without pyramid)
 - Large window more likely to cross an occlusion boundary (and it's slower)
 - 15x15 to 31x31 seems typical
- Weighting the window
 - Common to apply weights so that center matters more (e.g., with Gaussian)

Optical flow

Motion and perceptual organization

• Sometimes, motion is the only cue

Motion and perceptual organization

 Even "impoverished" motion data can evoke a strong percept

G. Johansson, "Visual Perception of Biological Motion and a Model For Its Analysis", *Perception and Psychophysics 14, 201-211, 1973.*

Motion and perceptual organization

 Even "impoverished" motion data can evoke a strong percept

G. Johansson, "Visual Perception of Biological Motion and a Model For Its Analysis", *Perception and Psychophysics 14, 201-211, 1973.*

Uses of motion

- Estimating 3D structure
- Segmenting objects based on motion cues
- Learning and tracking dynamical models
- Recognizing events and activities
- Improving video quality (motion stabilization)

Motion field

• The motion field is the projection of the 3D scene motion into the image

What would the motion field of a non-rotating ball moving towards the camera look like?

Optical flow

- Definition: optical flow is the *apparent* motion of brightness patterns in the image
- Ideally, optical flow would be the same as the motion field
- Have to be careful: apparent motion can be caused by lighting changes without any actual motion
 - Think of a uniform rotating sphere under fixed lighting vs. a stationary sphere under moving illumination

Lucas-Kanade Optical Flow

- Same as Lucas-Kanade feature tracking, but for each pixel
 - As we saw, works better for textured pixels
- Operations can be done one frame at a time, rather than pixel by pixel
 - Efficient

Iterative Refinement

- Iterative Lukas-Kanade Algorithm
 - 1. Estimate displacement at each pixel by solving Lucas-Kanade equations
 - Warp I(t) towards I(t+1) using the estimated flow field
 Basically, just interpolation
 - 3. Repeat until convergence

Coarse-to-fine optical flow estimation

Optical Flow Results

Optical Flow Results

Errors in Lucas-Kanade

- The motion is large
 - Possible Fix: Keypoint matching
- A point does not move like its neighbors
 Possible Fix: Region-based matching
- Brightness constancy does not hold
 - Possible Fix: Gradient constancy

Summary

- Major contributions from Lucas, Tomasi, Kanade
 - Tracking feature points
 - Optical flow
 - Stereo (later)
 - Structure from motion (later)
- Key ideas
 - By assuming brightness constancy, truncated Taylor expansion leads to simple and fast patch matching across frames
 - Coarse-to-fine registration
