- Substitution-Permutation Network (continued)
- Feistel Network
- Data Encryption Standard (DES)
- Block Cipher Modes of Operation

Block Cipher

$$F: \{0,1\}^n \times \{0,1\}^l \rightarrow \{0,1\}^l$$

n : key length

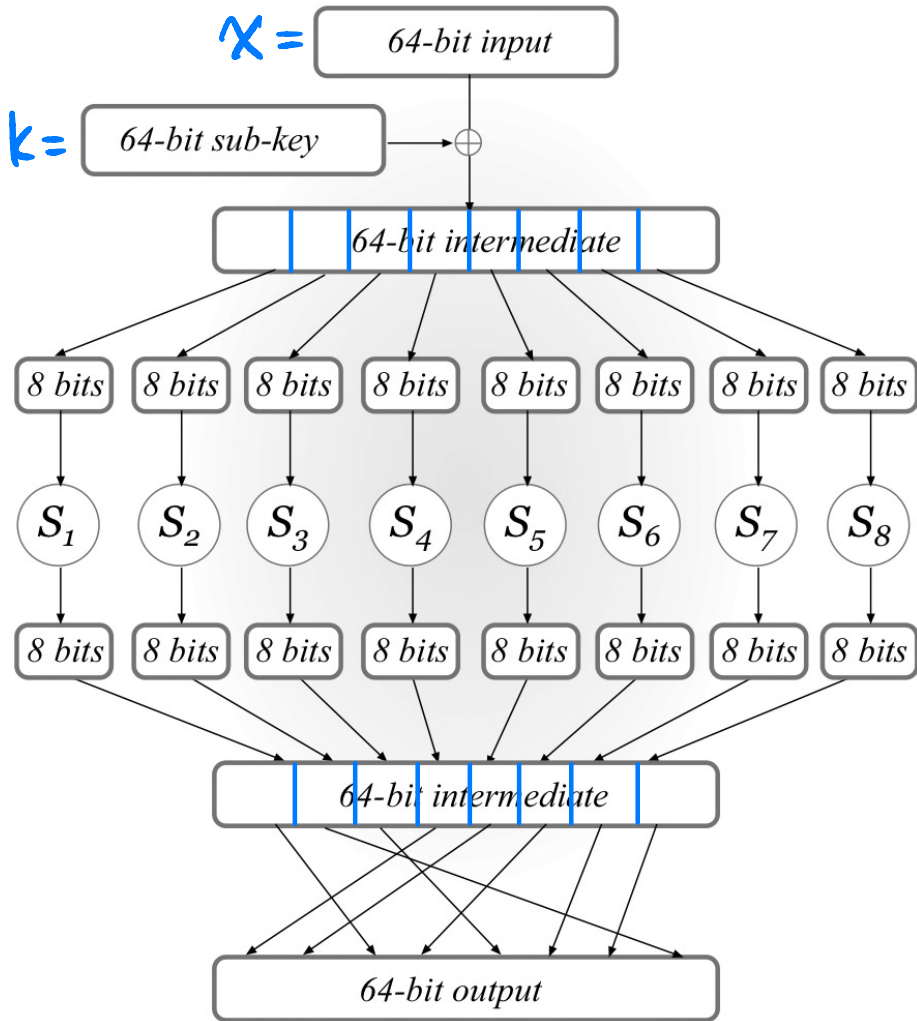

l : block length

$F_k(\cdot)$: permutation / bijective $\{0,1\}^l \rightarrow \{0,1\}^l$

$F_k^{-1}(\cdot)$: efficiently computable given k .

Assumed to be a pseudorandom permutation (PRP).

Substitution-Permutation Network (SPN)

A single round of SPN

"Confusion-Diffusion Paradigm"

Step 1: Key Mixing

$$X := X \oplus k$$

Step 2: Substitution (Confusion Step)

$$S_i: \{0,1\}^8 \rightarrow \{0,1\}^8 \quad (\text{S-box})$$

Public permutation / one-to-one map

1-bit change of input

→ at least 2-bit change of output

Step 3: Permutation (Diffusion Step)

$$P: [64] \rightarrow [64]$$

Public mixing permutation

↓
affect input to multiple S-boxes next round

Attacks on Reduced-Round SPN

1-round SPN without final key mixing?

$$\begin{array}{ccc}
 C & \xleftarrow{x} & A \\
 & \xrightarrow{y} & \Rightarrow k_1
 \end{array}$$

1-round SPN with final key mixing?

$$\begin{array}{ccc}
 C & \xleftarrow{x} & A \\
 & \xrightarrow{y} & \text{brute force search on } k_1 \Rightarrow k_2 \quad O(2^{16})
 \end{array}$$

Why do we need a final key mixing step?

Can we do r -round key mixing, then r -round substitution, then r -round permutation?

Feistel Network

3-round Feistel Network

$f_{k_i}: \{0,1\}^{n/2} \rightarrow \{0,1\}^{n/2}$

↑
round function

How to compute $F_k^{-1}(y)$?

Attacks on Reduced-Round Feistel Network

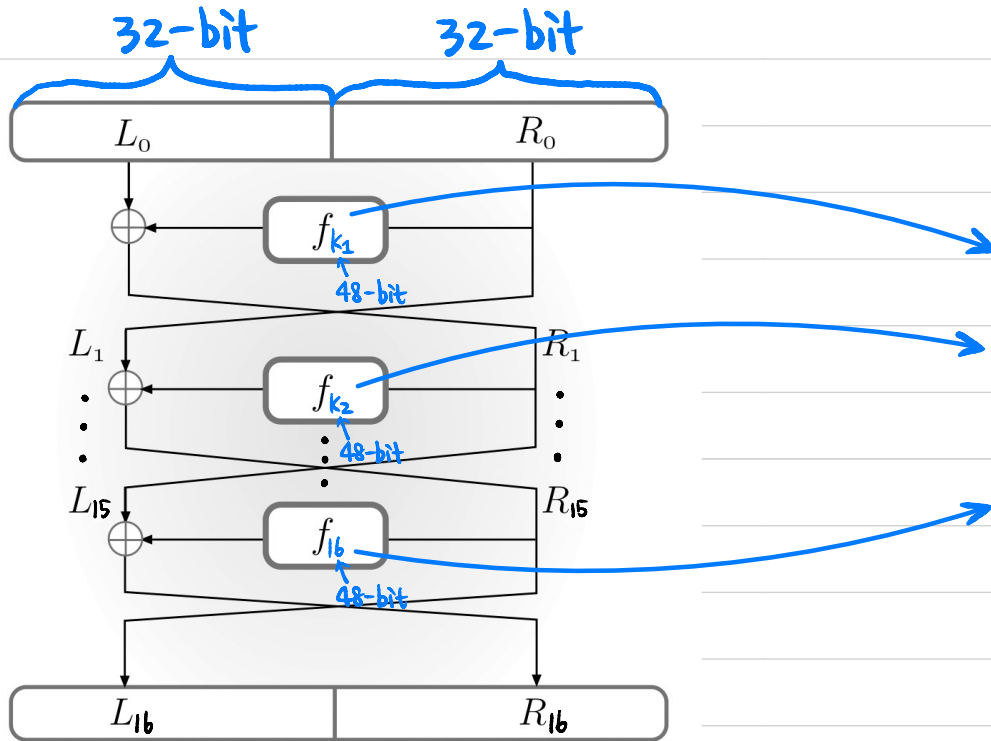

1-round ?

2-round ?

Data Encryption Standard (DES)

$F: \{0, 1\}^n \times \{0, 1\}^l \rightarrow \{0, 1\}^l$
 block length $l=64$
 master key length $n=56$

16-round Feistel Network

DES mangler function

Key Schedule:

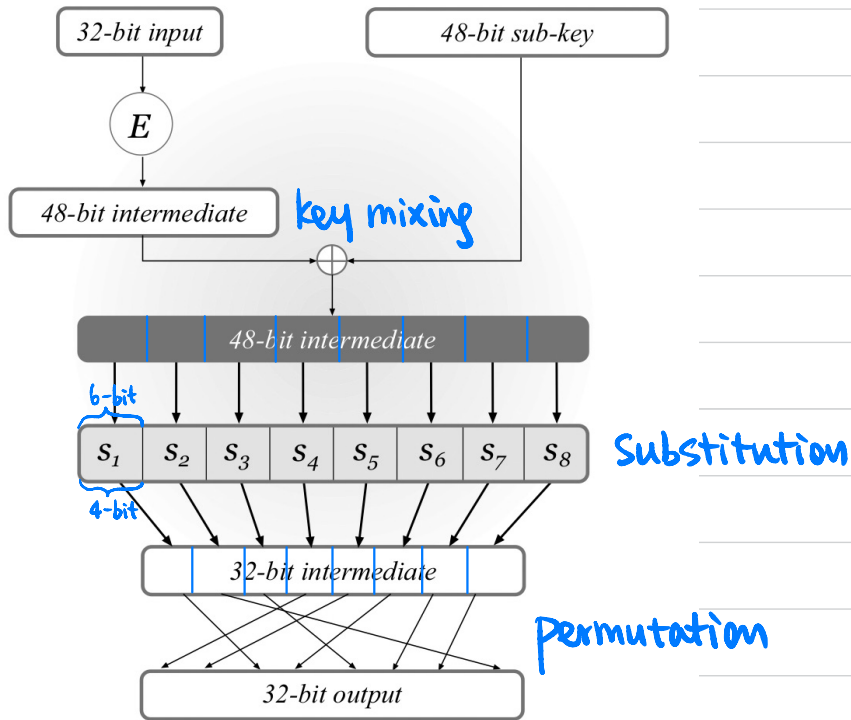

E: expansion function

Data Encryption Standard (DES)

DES mangler function

S-box: $\{0,1\}^6 \rightarrow \{0,1\}^4$

① "4-to-1":

Exactly 4 inputs map to same output

② 1-bit change of input

→ at least 2-bit change of output

Mixing Permutation: $[32] \rightarrow [32]$

4 bits from each S-box will affect the input to 6 S-boxes in the next round

Attacks on Reduced-Round SPN

1-round?

Can A recover sub-key in less than 2^{48} time?

2-round?

Advanced Encryption Standard (AES)

$$F: \{0,1\}^n \times \{0,1\}^l \rightarrow \{0,1\}^l$$

n: key length

l: block length

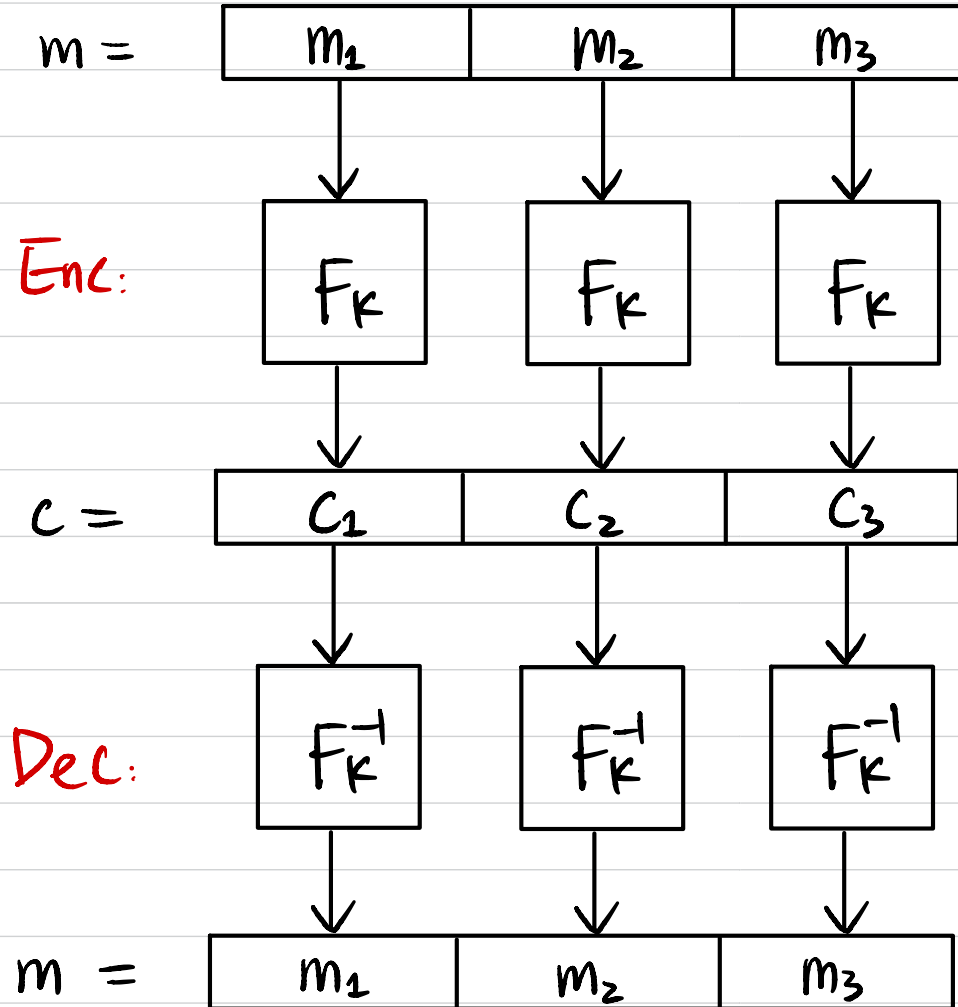

- $n = 128/192/256$, $l = 128$
- Standardized by NIST in 2001
- Competition 1997-2000

Block Cipher Modes of Operation

$$F: \{0,1\}^n \times \{0,1\}^n \rightarrow \{0,1\}^n$$

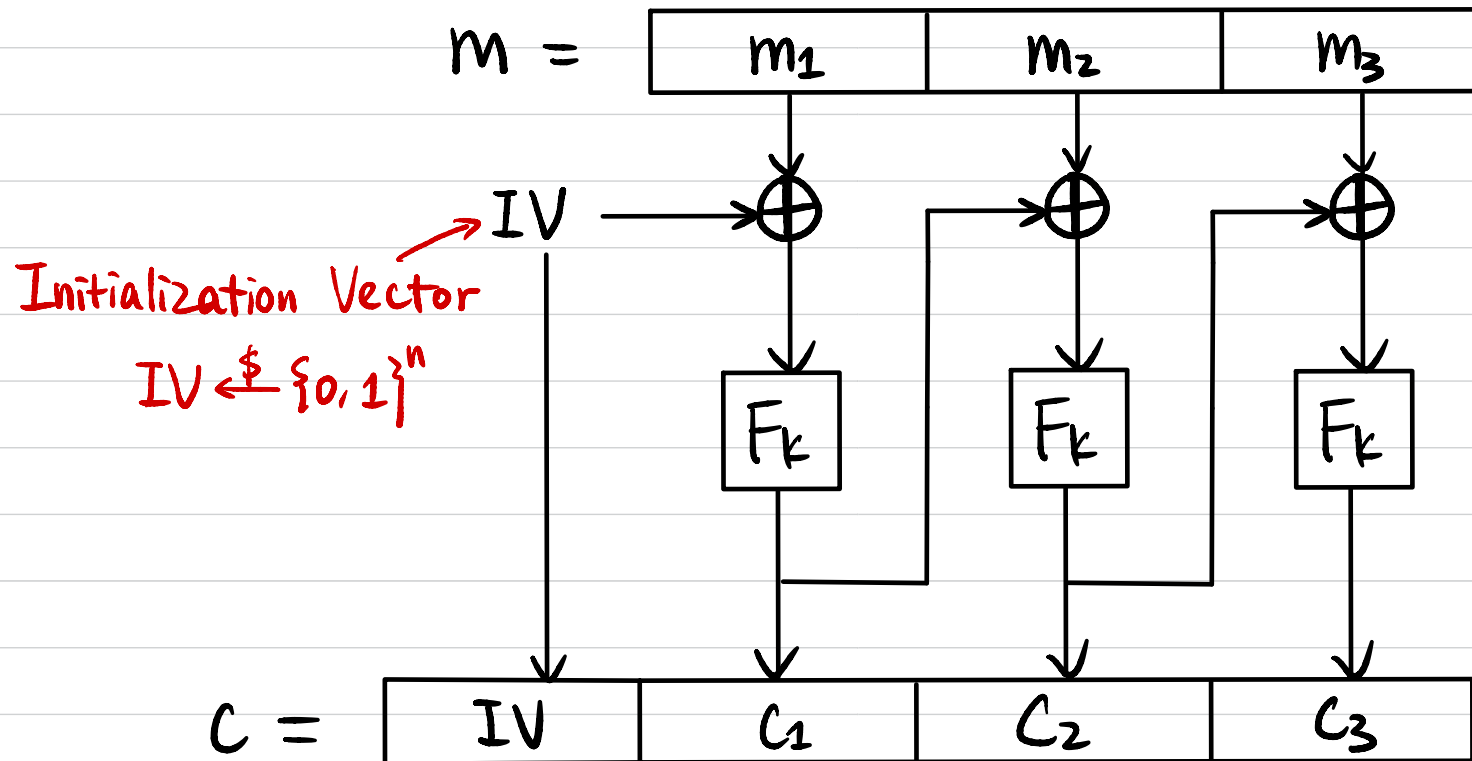

Goal: Construct a CPA-secure encryption scheme for arbitrary-length messages.
