- 2 The Basic Three HMM Problems
- 3 HMM: basic variables and probailities
- Solution to Problem 3: The Expectation-Maximization Algorithm
  - The Reestimation Equations
  - The EM Algorithm
  - Baum's Q-function and the Baum-Welch Theorem
  - The Stochastic Contraints
  - Lagrangean multipliers for the solution of the max-optimization

- Observation sequence  $\mathcal{O} = o_1, ..., o_T$ and HMM model  $\lambda = (A, B, \pi)$
- Problem 1: The Evaluation Problem

Given:  $\mathcal{O}, \lambda$ 

Compute:  $P(\mathcal{O} \mid \lambda)$  the probability of the observation sequence given the HMM model

• Problem 2: The Decoding Problem

Given:  $\mathcal{O}, \lambda$ 

Compute: A sequence of states Q for the observation sequence  $\mathcal{O}$ ,  $Q = q_1, ..., q_T$  which optimally "explains" the observation sequence.

• Problem 3: The Learning Problem

Given: O

Compute: the parameters of an HMM model  $\lambda$  that maximizes the probability  $P(\mathcal{O} \mid \lambda)$  of observing  $\mathcal{O}$  in the model  $\lambda$ 

- Observation sequence  $\mathcal{O} = o_1, ..., o_T$ and HMM model  $\lambda = (A, B, \pi)$
- Problem 1: The Evaluation Problem
   Given: O, λ
   Compute: P(O | λ) the probability of the observation sequence given the HMM model

(日)

### Problem 2

- Observation sequence  $\mathcal{O} = o_1, ..., o_T$ and HMM model  $\lambda = (A, B, \pi)$
- Problem 2: The Decoding Problem

Given:  $\mathcal{O}, \lambda$ Compute: A sequence of states Q for the observation sequence  $\mathcal{O}, Q = q_1, ..., q_T$  which optimally "explains" the observation sequence.

### Problem 3

- Observation sequence  $\mathcal{O} = o_1, ..., o_T$ and HMM model  $\lambda = (A, B, \pi)$
- Problem 3: The Learning Problem

Given:  $\mathcal{O}$ Compute: the parameters of an HMM model  $\lambda$  that maximizes the probability  $P(\mathcal{O} \mid \lambda)$  of observing  $\mathcal{O}$  in the model  $\lambda$ 

# Elements of an HMM

• *N* is the number of states  $S = \{S_1, ..., S_N\}$ . The HMM process proceeds in discrete units of time, t = 1, 2, 3, ....

The state at time t is denoted by  $q_t$ .

- ② *M* is the number of distinct **observation symbols** per state  $V = v_1, ..., v_M$
- The transition probability distribution is given by  $A = \{a_{ij}\}$ , where

 $a_{ij} = P[q_{t+1} = S_j \mid q_t = S_i], 1 \le i, j, \le N$ 

The observation symbols probability distribution in state j is given by

$$B = \{b_j(k) = P[v_k \text{ at time } t \mid q_t = S_j], \\ 1 \le i \le N, 1 \le k \le M$$

S The initial state distribution is given by

۲

۲

# Basic variables and probabilities

- a sequence of states is  $Q = \{q_1, q_2, ..., q_T\}$
- The probability of observing the sequence  ${\mathcal O}$  in sequence of states Q is

$$P(\mathcal{O} \mid Q) = \prod_{i=1}^{T} P((o_i \mid q_i))$$

$$P(\mathcal{O} \mid Q) = b_{q_1}(o_1)...b_{q_T}(o_T)$$

$$P(Q) = \pi_{q1}a_{q_1q_2}a_{q_2q_3}...a_{q_{T-1}q_T}$$

$$P(\mathcal{O}, Q) = P(\mathcal{O} \mid Q)P(Q)$$

★ ∃ ► < ∃ ►</p>

Basic variables and probabilities

 $\bullet$  the probability of observing  ${\cal O}$  is

۲

۲

$$P(\mathcal{O}) = \sum_{allQ} P(\mathcal{O} \mid Q) P(Q)$$

$$= \sum_{q_1...q_T} \pi_{q_1} b_{q_1}(o_1) a_{q_1q_2} b_{q_2}(o_2) ... a_{q_{T-1}q_T} b_{q_T}(o_T)$$

★ Ξ →

Outline The Basic Three HMM Problems HMM: basic variables and probailities

Solution to Problem 3: The Expectation-Maximization Algorithm

# the Forward variable $\alpha_t(i)$

۲

• The Forward variable is defined by

$$\alpha_t(i) = P(o_1 o_2 \dots o_t, q_t = S_i)$$

 i.e., the probability of the prefix of the sequence of observations o<sub>1</sub>...o<sub>t</sub> until time t and being in state S<sub>i</sub> at time t

the Backward variable  $\beta_t(i)$ 

• The Backward variable is defined by

۲

$$\beta_t(i) = P(o_{t+1}o_{t+2}...o_T, q_t = S_i)$$

 i.e., the probability of the suffix of the sequence of observations o<sub>t+1</sub>o<sub>t=2</sub>...o<sub>T</sub> until end of sequence t and being in state S<sub>i</sub> at time t

# the Delta variable $\delta_t(i)$

- The  $\delta_t(i)$  variable is defined by
- ۲

$$\delta_t(i) = MAX_{q_1...q_{t-1}} P(q_1...q_{t-1}q_t, o_1...o_{t-1}o_t)$$

• i.e., the best score (highest probability) along the single path, at time t which accounts for the first t observations and ends in state S<sub>i</sub>

Outline The Basic Three HMM Problems HMM: basic variables and probailities Solution to Problem 3: The Expectation-Maximization Algorithm	The Reestimation Equations The EM Algorithm Baum's Q-function and the Baum-Welch Theorem The Stochastic Contraints Lagrangean multipliers for the solution of the max-optimization
---	--

- By far the most difficult of the three problems.
- We want to adjust the parameters of the model λ = (A, B, π) to maximize the probability of observing the sequence in the model.
- There is no exact analytical solution to this problem.
- Both Problem 1 and Probem 2 have solutions given by algorithms that we presented in CS 1810. Those algorithms are exact and having computing time  $O(N^2 T)$ .

Outline The Basic Three HMM Problems HMM: basic variables and probailities Solution to Problem 3: The Expectation-Maximization Algorithm	The Reestimation Equations The EM Algorithm Baum's Q-function and the Baum-Welch Theorem The Stochastic Contraints Lagrangean multipliers for the solution of the max-optimization
---	--

- We can choose  $\lambda' = (A', B', \pi')$  such that  $P(\mathcal{O} \mid \lambda')$  is locally maximal.
- We use the **Baum-Welch Algorithm**. This is an iterative algorithm. We iterate untill no improvement is possible. At that point we reached a local maxima.

For this iteration we are using a method for reesttimation of the HMM parameters.

Solution to Problem 3: The Expectation-Maximization Algorithm Lagrangean multipliers for the solution of the max-optimization
---

# the Xi variable $\xi(ij)$

- We first define a new variable  $\xi$
- $\xi_t(i,j)$  = the probability of being in state  $S_i$  at time t and state  $S_j$  at time t + 1, given the model and the observation sequence

• 
$$\xi_t(i,j) = P(q_t = S_i, q_{t+1} = S_j \mid \mathcal{O}, \lambda)$$

HMM: basic variables and probalities Solution to Problem 3: The Expectation Maximization Algorithm The Stoch	
---	--

• From the definition of  $\alpha$  and  $\beta$  variables we can write  $\xi$  as follows:

$$\xi_t(i,j) = \frac{\alpha_t(i)a_{ij}b_j(o_{t+1})\beta_{t+1}(j)}{P(\mathcal{O} \mid \lambda)}$$
$$= \frac{\alpha_t(i)a_{ij}b_j(o_{t+1})\beta_{t+1}(j)}{\sum_{i'=1}^N \sum_{j'=1}^N \alpha_t(i')a_{i'j'}b_{j'}(o_{t+1})\beta_{t+1}(j')}$$

	Lagrangean multipliers for the solution of the max-optimization

• The numerator is:

۲

$$P(q_t = S_i, q_{t+1} = S_j, \mathcal{O} \mid \lambda)$$

and the denominator is the normalization factor to give the probability:

۲

$$P(\mathcal{O} \mid \lambda) = \sum_{i'=1}^{N} \sum_{j'=1}^{N} \alpha_t(i') \mathbf{a}_{i'j'} \mathbf{b}_{j'}(\mathbf{o}_{t+1}) \beta(j')$$

(日)

### the Gamma variable $\gamma_t(i)$

• As  $\gamma_t(i)$  is the probability of being in state  $S_i$  at time t given the observation sequence and model we have

$$\gamma_t(i) = \sum_{j=1}^N \xi_t(i,j)$$

Solution to Problem 3: The Expectation Maximization Algorithm The Stochastic Contraints	Outline The Basic Three HMM Problems HMM: basic variables and probailities Solution to Problem 3: The Expectation-Maximization Algorithm	The Reestimation Equations The EM Algorithm Baum's Q-function and the Baum-Welch Theorem The Stochastic Contraints Lagrangean multipliers for the solution of the max-optimization
---	---	--

• The expected number of times state S<sub>i</sub> is visited or equivalently the expected number of transitions made from S<sub>i</sub> is

$$\sum_{t=1}^{T-1} \gamma_t(i) =$$

= the expected number of transitions from  $S_i$ 

• Similarly,

٥

۵

$$\sum_{t=1}^{T-1}\xi_t(i,j) =$$

= the expected number of transitions from  $S_i$  to  $S_j$ 

The Reestimation Equations The EM Algorithm Baum's Q-function and the Baum-Welch Theorem The Stochastic Contraints Lagrangean multipliers for the solution of the max-optimizatio

(日)

۵

 A set of resonable reestimations for the parameters π, A, B are given as follows:

$$ar{\pi} = \gamma_1(i), 1 \leq i \leq N$$

 i.e., the expected frequency (number of times) in state S<sub>i</sub> at time (t = 1) is = γ<sub>1</sub>(i)

The Reestimation Equations The EM Algorithm Baum's Q-function and the Baum-Welch Theorem The Stochastic Contraints Lagrangean multipliers for the solution of the max-optimizatio

(日)

# Reestimating $A = \{a_{ij}\}$

۲

$$\bar{a_{ij}} = \frac{\sum_{t=1}^{T-1} \xi_t(i,j)}{\sum_{t=1}^{T-1} \gamma_t(i)}$$

• i.e., (expected number of transitions from  $S_i$  to  $S_j$ )/ (exected number of transitions from  $S_i$ )

The Reestimation Equations The EM Algorithm Baum's Q-function and the Baum-Welch Theorem The Stochastic Contraints Lagrangean multipliers for the solution of the max-optimizatio

(日)

# Reestimating $B = b_j(k)$

٩

$$\bar{b}_j(k) = \frac{\sum_{t=1,o_t=v_k}^T \gamma_t(j)}{\sum_{t=1}^T \gamma_t(j)}$$

 i.e., (expected number of times in state S<sub>j</sub> observing observation symbol v<sub>k</sub>)/ (expected number of times in state S<sub>j</sub>)

 The EM Algorithm

 HMM: basic variables and probalilities
 Baum's Q-function and the Baum-Welch Theorem

 Solution to Problem 3: The Expectation-Maximization Algorithm
 The Stochastic Contraints

- Let the current model  $\lambda = (A, B, \pi)$
- Compute the above reestimation to get a new model  $\bar{\lambda}=(\bar{A},\bar{B},\bar{\pi})$
- Then
  - (1)  $\lambda$  is a local optimum, i.e.,  $\lambda = \overline{\lambda}$ , or
  - 2  $\bar{\lambda}$  is more likely that  $\lambda$  in the sense that

$$P(\mathcal{O} \mid \overline{\lambda}) > P(\mathcal{O} \mid \lambda)$$

, i.e., we have found a new model  $\bar{\lambda}$  from which the observation sequence is more likely to have been produced.

The Reestimation Equations **The EM Algorithm** Baum's Q-function and the Baum-Welch Theorem The Stochastic Contraints Lagrangean multipliers for the solution of the max-optimization

# The maximum likelihood HMM estimate

- If we consider this reestimation, the final result of this reestimation procedure is called a **maximum likelihood** estimate of the HMM
- The Forward-Backward algorithm leads to a local maxima

< □ > < 同 >

< ∃ →

The Reestimation Equations The EM Algorithm Baum's Q-function and the Baum-Welch Theorem The Stochastic Contraints Lagrangean multipliers for the solution of the max-optimization

# Baum's Q-function and the Baum-Welch Theorem

- The reestimation formulas can be derived directly by maximization (using constrained optimization) of Baum's auxilary function:
- ٥

$$Max_{\bar{\lambda}}\mathcal{Q}(\lambda,\bar{\lambda}) = sum_Q P(Q \mid \mathcal{O},\lambda) \log(P(\mathcal{O},Q \mid \lambda))$$

• Baum-Welch Theorem:

$$\mathit{Max}_{\bar{\lambda}}(\mathcal{Q}(\lambda, \bar{\lambda})$$

implies that

$$P(\mathcal{O} \mid \overline{\lambda}) \geq P(\mathcal{O} \mid \lambda)$$

The Reestimation Equations The EM Algorithm Baum's Q-function and the Baum-Welch Theorem The Stochastic Contraints Lagrangean multipliers for the solution of the max-optimizatior

イロト イポト イヨト イヨ

# The EM Algorithm

- The reestimation procedure can be implemented as the **Expectation-Maximization (EM) Algorithm** due to Dempster, Laird and Rubin (1977)
- The **E-step** (Expectation) is the calculation of the Baum's auxiliary function  $\mathcal{Q}(\lambda, \bar{\lambda})$
- The **M-step** (Maximization) is the maximization of  $\bar{\lambda}$

The Reestimation Equations The EM Algorithm Baum's Q-function and the Baum-Welch Theorem **The Stochastic Contraints** Lagrangean multipliers for the solution of the max-optimization

(日)

# The stochastic contraints

۲

۵

• The stochastic contraints for the model are automatically satisfied at each iteration:

$$\sum_{i=1}^{N} ar{\pi}_i = 1, 1 \leq j \leq N$$
 $\sum_{i=1}^{N} ar{a_{ij}} = 1, 1 \leq j \leq N$ 

$$\sum_{k=1}\bar{b}_j(k)=1$$

The Reestimation Equations The EM Algorithm Baum's Q-function and the Baum-Welch Theorem The Stochastic Contraints Lagrangean multipliers for the solution of the max-optimization

# Viewing the parameter optimization problem as an optimization problem

• We can solve the parameter estimation problem as a constraint optimization problem for

### $P(\mathcal{O} \mid \lambda)$

under the stochastic contraints by using the Lagrangean multipliers method. It shows that P is maximized when the following hold:

< 口 > < 同 >

۲

٠

The Reestimation Equations The EM Algorithm Baum's Q-function and the Baum-Welch Theorem The Stochastic Contraints Lagrangean multipliers for the solution of the max-optimization

(日)

### Lagrangean multipliers for the solution of the optimization

 $\pi_i = \frac{\pi_i \frac{\partial P}{\partial \pi_i}}{\sum_{k=1}^{N} \pi_k \frac{\partial P}{\partial \pi_k}}$ 

$$a_{ij} = rac{a_{ij}rac{\partial P}{\partial a_{ij}}}{\sum_{k=1}^{N}a_{ik}rac{\partial P}{\partial a_{ik}}}$$

$$b_i(k) = \frac{b_i(k)\frac{\partial P}{\partial b_i(k)}}{\sum_{l=1}^M b_i(l)\frac{\partial P}{\partial b_i(l)}}$$

--	---

- By appropriate manipulation of those formulas the right-hand sides of each equaltion can be ready converted to be identical to the right-sides of the EM algorithm reestimations.
- This shows that the reestimation formulas are indeed exactly correct at local optimal points of P(O | λ)
