Probabilistic Graphical Models

Brown University CSCI 2950-P, Spring 2013 Prof. Erik Sudderth

Lecture 20: Structured Variational Methods, Bethe Approximations and Loopy BP

$$\begin{aligned} & \text{Mean Field versus Belief Propagation} \\ & p(x) = \frac{1}{Z} \prod_{(s,t) \in \mathcal{E}} \psi_{st}(x_s, x_t) \prod_{s \in \mathcal{V}} \psi_s(x_s) & \phi_{st}(x_s, x_t) = -\psi_{st}(x_s, x_t) \\ & q_t(x_t) \propto \psi_t(x_t) \prod_{u \in \Gamma(t)} m_{ut}(x_t) & & & \\ & \text{MF:} \quad m_{ts}(x_s) \propto \exp\left\{-\sum_{x_t} \phi_{st}(x_s, x_t) q_t(x_t)\right\} & & \text{MF:} \quad m_{ts}(x_s) \propto \sum_{x_t} \psi_{st}(x_s, x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{BP:} \quad m_{ts}(x_s) \propto \sum_{x_t} \psi_{st}(x_s, x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{Optimized on } \\ & \text{Optimized on } \\ & \text{MF:} \quad m_{ts}(x_s) \propto \sum_{x_t} \psi_{st}(x_s, x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{Optimized on } \\ & \text{MF:} \quad m_{ts}(x_s) \propto \sum_{x_t} \psi_{st}(x_s, x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{Optimized on } \\ & \text{MF:} \quad m_{ts}(x_s) \propto \sum_{x_t} \psi_{st}(x_s, x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{Optimized on } \\ & \text{MF:} \quad m_{ts}(x_s) \propto \sum_{x_t} \psi_{st}(x_s, x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{Optimized on } \\ & \text{MF:} \quad m_{ts}(x_s) \propto \sum_{x_t} \psi_{st}(x_s, x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{Optimized on } \\ & \text{MF:} \quad m_{ts}(x_s) \propto \sum_{x_t} \psi_{st}(x_s, x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{Optimized on } \\ & \text{MF:} \quad m_{ts}(x_s) \propto \sum_{x_t} \psi_{st}(x_s, x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{MF:} \quad m_{ts}(x_t) \propto \sum_{x_t} \psi_{st}(x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{MF:} \quad m_{ts}(x_t) \propto \sum_{x_t} \psi_{st}(x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{MF:} \quad m_{ts}(x_t) \propto \sum_{x_t} \psi_{st}(x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{MF:} \quad m_{ts}(x_t) \propto \sum_{x_t} \psi_{st}(x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{MF:} \quad m_{ts}(x_t) \propto \sum_{x_t} \psi_{st}(x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{MF:} \quad m_{ts}(x_t) \propto \sum_{x_t} \psi_{st}(x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{MF:} \quad m_{ts}(x_t) \propto \sum_{x_t} \psi_{st}(x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{MF:} \quad m_{ts}(x_t) \propto \sum_{x_t} \psi_{st}(x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{MF:} \quad m_{ts}(x_t) \propto \sum_{x_t} \psi_{st}(x_t) \frac{q_t(x_t)}{m_{st}(x_t)} & & \\ & \text{MF:} \quad m_{ts}(x_t) \propto \sum_{x_t} \psi_{st}(x_t) + & \\ & \text{MF:} \quad m_{ts}(x_t) \propto \sum_{x_t} \psi_{st}(x_t) + & \\ & \text{MF:} \quad m_{ts}(x_t) \propto \sum_{x_t} \psi_{st}(x_t) + & \\ & \text{MF:} \quad m_{ts}(x_t) \propto \sum_{$$

Big implications from small changes:

- Mean Field: Guaranteed to converge for general graphs, always lower-bounds partition function, but approximate even on trees
- Belief Propagation: Produces exact marginals for any tree, but for general graphs no guarantees of convergence or accuracy
- Goal: Can we justify and generalize loopy BP?

Mean Field Free Energy

$$p(x) = \frac{1}{Z} \exp \left\{ -\sum_{(s,t)\in\mathcal{E}} \phi_{st}(x_s, x_t) - \sum_{s\in\mathcal{V}} \phi_s(x_s) \right\}$$
$$q(x) = \prod_{s\in\mathcal{V}} q_s(x_s) \qquad \phi_{st}(x_s, x_t) = -\log \psi_{st}(x_s, x_t)$$
$$\phi_s(x_s) = -\log \psi_s(x_s)$$

$$D(q || p) = -H(q) + \sum_{x} q(x)E(x) + \log Z$$

Mean Field Entropy:

$$H(q) = \sum_{s \in \mathcal{V}} H_s(q_s) = -\sum_{s \in \mathcal{V}} \sum_{x_s} q_s(x_s) \log q_s(x_s)$$

Mean Field Average Energy (expected sufficient statistics):

$$\sum_{x} q(x)E(x) = \sum_{(s,t)\in\mathcal{E}} \sum_{x_s,x_t} q_s(x_s)q_t(x_t)\phi_{st}(x_s,x_t) + \sum_{s\in\mathcal{V}} \sum_{x_s} q_s(x_s)\phi_s(x_s)$$

Markov Chain Factorizations

$$p(x) = \frac{1}{Z} \prod_{(s,t)\in\mathcal{E}} \psi_{st}(x_s, x_t) \prod_{s\in\mathcal{V}} \psi_s(x_s)$$

Tree Structured Variational Methods

Trees exactly factorize as

$$q(x) = \prod_{(s,t)\in\mathcal{E}} \frac{q_{st}(x_s, x_t)}{q_s(x_s), q_t(x_t)} \prod_{s\in\mathcal{V}} q_s(x_s) \mathcal{O}$$

• We may then optimize over all distributions which are Markov with respect to a tree-structured graph:

$$D(q \mid\mid p) = -H(q) + \sum_{x} q(x)E(x) + \log Z$$

$$\sum_{x} q(x)E(x) = \sum_{(s,t)\in\mathcal{E}} \sum_{x_s,x_t} q_{st}(x_s,x_t)\phi_{st}(x_s,x_t) + \sum_{s\in\mathcal{V}} \sum_{x_s} q_s(x_s)\phi_s(x_s)$$

$$H(q) = \sum_{s\in\mathcal{V}} H_s(q_s) - \sum_{(s,t)\in\mathcal{E}} I_{st}(q_{st})$$

Marginal
Entropies Mutual
Information

Tree Structured Variational Methods

Trees exactly factorize as

$$q(x) = \prod_{(s,t)\in\mathcal{E}} \frac{q_{st}(x_s, x_t)}{q_s(x_s), q_t(x_t)} \prod_{s\in\mathcal{V}} q_s(x_s) \mathcal{O}^{-}$$

• We may then optimize over all distributions which are Markov with respect to a tree-structured graph:

$$D(q || p) = -H(q) + \sum_{x} q(x)E(x) + \log Z$$

$$\sum_{x} q(x)E(x) = \sum_{(s,t)\in\mathcal{E}} \sum_{x_s,x_t} q_{st}(x_s, x_t)\phi_{st}(x_s, x_t) + \sum_{s\in\mathcal{V}} \sum_{x_s} q_s(x_s)\phi_s(x_s)$$

$$H(q) = \sum_{s\in\mathcal{V}} H_s(q_s) - \sum_{(s,t)\in\mathcal{E}} I_{st}(q_{st})$$

$$H_s(q_s) = -\sum_{x_s} q_s(x_s)\log q_s(x_s) \qquad I_{st}(q_{st}) = \sum_{x_s,x_t} q_{st}(x_s, x_t)\log \frac{q_{st}(x_s, x_t)}{q_s(x_s)q_t(x_t)}$$

Bethe Variational Approximations

Bethe approximation uses the treestructured free energy form even though the graph has cycles

$$D(q || p) = -H(q) + \sum_{x} q(x)E(x) + \log Z$$

Average Energy

$$\sum_{x} q(x)E(x) = \sum_{(s,t)\in\mathcal{E}} \sum_{x_s,x_t} q_{st}(x_s,x_t)\phi_{st}(x_s,x_t) + \sum_{s\in\mathcal{V}} \sum_{x_s} q_s(x_s)\phi_s(x_s)$$

Approximate Entropy

$$H(q) \approx \sum_{s \in \mathcal{V}} H_s(q_s) - \sum_{(s,t) \in \mathcal{E}} I_{st}(q_{st}) \qquad \tilde{q}_s(x_s) = \sum_{x_t} q_{st}(x_s, x_t)$$
$$H_s(q_s) = -\sum_{x_s} q_s(x_s) \log q_s(x_s) \qquad I_{st}(q_{st}) = \sum_{x_s, x_t} q_{st}(x_s, x_t) \log \frac{q_{st}(x_s, x_t)}{\tilde{q}_s(x_s)\tilde{q}_t(x_t)}$$

Optimization must enforce marginalization constraints

$$\begin{aligned} & \mathcal{L}(q,\lambda) = \\ & + \sum_{s \in \mathcal{V}} \sum_{x_s} q_s(x_s) (\phi_s(x_s) + \log q_s(x_s)) & \tilde{q}_s(x_s) = \sum_{x_t} q_{st}(x_s, x_t) \\ & + \sum_{s \in \mathcal{V}} \sum_{x_s} q_{st}(x_s, x_t) \left(\phi_{st}(x_s, x_t) + \log \frac{q_{st}(x_s, x_t)}{\tilde{q}_s(x_s)\tilde{q}_t(x_t)} \right) \\ & + \sum_{s \in \mathcal{V}} \lambda_{ss} \left(1 - \sum_{x_s} q_s(x_s) \right) \\ & + \sum_{(s,t) \in \mathcal{E}} \left[\sum_{x_s} \lambda_{ts}(x_s) \left(q_s(x_s) - \sum_{x_t} q_{st}(x_s, x_t) \right) + \sum_{x_t} \lambda_{st}(x_t) \left(q_t(x_t) - \sum_{x_s} q_{st}(x_s, x_t) \right) \right] \end{aligned}$$

Constraints not explicitly enforced:

$$1 - \sum_{x \in T} q_{st}(x_s, x_t) = 0 \qquad q_s(x_s) \ge 0, q_{st}(x_s, x_t) \ge 0$$

 x_s, x_t

Implied by other equality constraints

Inactive, will be automatically satisfied by solution we derive

Derivation: Bethe to Loopy BP

Derivation on whiteboard. For details, see:

BP Algorithm

Bethe Approximations and Loopy BP

$$D(q || p) = -H(q) + \sum_{x} q(x)E(x) + \log Z$$

$$\int_{x} q(x)E(x) = \sum_{(s,t)\in\mathcal{E}} \sum_{x_s,x_t} q_{st}(x_s,x_t)\phi_{st}(x_s,x_t) + \sum_{s\in\mathcal{V}} \sum_{x_s} q_s(x_s)\phi_s(x_s)$$

$$H(q) \approx \sum_{s\in\mathcal{V}} H_s(q_s) - \sum_{(s,t)\in\mathcal{E}} I_{st}(q_{st})$$

- For a tree-structure graphical model, entropy approximation becomes exact, and unique solution gives true marginals
- For general graphs, there is a correspondence between fixed points of the loopy belief propagation algorithm and stationary points of the Bethe variational objective
- Biggest practical applications:
 - Alternative, stable algorithms for Bethe objective
 - Message passing algorithms from fancier objectives

Implications for Loopy BP

Bethe Free Energy is an Approximation

- BP may have multiple fixed points (non-convex)
- BP is not guaranteed to converge
- Few general guarantees on BP's accuracy

Characterizations of BP Fixed Points

- All graphical models have at least one BP fixed point
- Stable fixed points are local minima of Bethe
- For graphs with cycles, BP is almost never exact
- As cycles grow long, BP becomes exact (coding)

Structured Mean Field

Original Graph

Naïve Mean Field

Structured Mean Field

 Any subgraph for which inference is tractable leads to a mean field style approximation for which the update equations are tractable

Structured Mean Field

$$p(x) = \frac{1}{Z} \prod_{(s,t)\in\mathcal{E}} \psi_{st}(x_s, x_t) \prod_{s\in\mathcal{V}} \psi_s(x_s) \qquad \phi_{st}(x_s, x_t) = -\psi_{st}(x_s, x_t)$$

$$q_t(x_t) \propto \psi_t(x_t) \prod_{u\in\Gamma(t)} m_{ut}(x_t)$$

$$\text{MF:} \quad m_{ts}(x_s) \propto \exp\left\{-\sum_{x_t} \phi_{st}(x_s, x_t)q_t(x_t)\right\}$$

$$\text{BP:} \quad m_{ts}(x_s) \propto \sum_{x_t} \psi_{st}(x_s, x_t) \frac{q_t(x_t)}{m_{st}(x_t)} \qquad \bigcirc x_s$$

For the special case of a discrete pairwise MRF:

- Choose a subset of *core* edges which form no cycles
- On *core* edges, apply BP message updates
- On other edges, apply MF message updates
- Guaranteed convergent, optimizes lower bound on Z
