Error Ratio

(image 1~4 x kernel 1~8)

An error ratio > 3 (in red) is deemed as failure according to Levin *et al* 2011.

Note: sparse deconvolution is used as the final non-blind deconvolution method to produce the latent image on our own estimated kernels, using the code provided by Levin *et al* 2011.

Results on Our Synthetic Dataset

Thumbnails of 80 diverse scenes (used in grayscale)

- 80 images, 8 kernels
- All kernels are estimated assuming size 51×51 (but 29×29 is used here for Levin *et al* for better results)
- Zoran and Weiss (identical parameters) is used as the final non-blind deconvolution method
- Kernels are centered, cropped, and zoomed
- Output images are aligned with ground truth to minimize SSDE, maximize PSNR

Complete Evaluation on Our Synthetic Dataset (640 images)

- Geometric mean of error ratios are shown in the legend. Lower is better.
- “Default” means that we use method_i as is, no modifications. Otherwise Zoran & Weiss is used to deconvolve the image using the estimated kernel from method_i.
