

Parallel Homomorphic Encryption

Seny Kamara – Microsoft Research

Mariana Raykova – IBM Research

Big Data

The scale of data we create is growing rapidly

Walmart: 2.5 petabytes of transaction data per day

Jets: 10 terabytes of sensor data per 30 mins of flight

Large Hadron Collider: 40 terabytes per second

How do we process this data?

Too much for any single machine (even supercomputer)

Clusters of machines

Cluster Computing

Distribute data

Synchronization

Fault tolerance

Parallel algorithms

MapReduce [Dean-Ghemawat04]

A framework

- Distributed file system

- Fault tolerance

- Synchronization

A model for parallel computation

- easy to design parallel algorithms

Standard for processing Big Data

MapReduce [Dean-Ghemawat04]

MapReduce program

Map(k_i, v_i) \rightarrow (ik_1, iv_1), ..., (ik_t, iv_t)

Reduce(ik_i, S_i) \rightarrow out_{*i*}

MapReduce [Dean-Ghemawat04]

MapReduce algorithm

Map(k_i, v_i) \rightarrow (ik_1, iv_1), ..., (ik_t, iv_t)

Reduce(ik_i, S_i) \rightarrow out _{i}

MapReduce

Many MapReduce algorithms

IR: counts, searching, sorting, pagerank, HITS, ...

ML: PCA, neural networks, regression, support vector machines, ...

Graphs: BFS, DFS, pagerank, minimum spanning tree, ...

The Big Data Stack

Pig, ...

analytics languages

HBase, Hive, Hadoop, ...

databases (SQL & NoSQL)

Hadoop, MapR, Hortonworks, Cloudera, ...

MapReduce frameworks

Amazon Elastic MapReduce, Azure HDInsight

Cloud-based MapReduce

What if I don't trust the
Cloud?

MapReduce on Encrypted Data?

Use homomorphic encryption!

- Client encrypts data

- Cluster computes homomorphically

Question?

- Can homomorphic evaluation be done in parallel?

- Can it be done on a standard MapReduce cluster?

Parallel Homomorphic Encryption

PHE = (Gen, Enc, Eval, Dec)

Gen(1^k)

Enc(K, m)

Eval(f, c_1, \dots, c_n) \approx MapReduce algorithm

Dec(K, c)

PHE = (Gen, Enc, Parse, Map, Reduce, Merge, Dec)

Parse(c) generates (encrypted) key-value pairs for mappers

Map(k, v) homomorphically evaluates map algorithm

Reduce(ik, S) homomorphically evaluates reduce algorithm

Security

CPA-security

Adversary cannot learn any information about message from ciphertext

Note

Here single-input security is enough

Constructions

A High-Level Framework

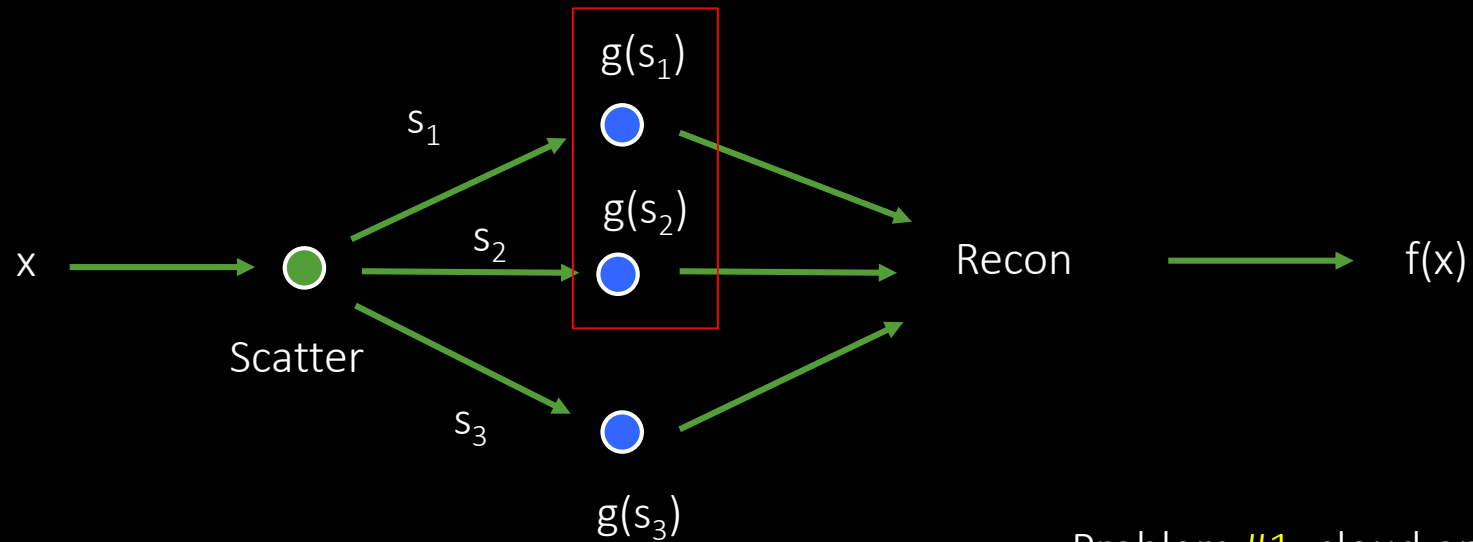

PHE = Randomized reductions + homomorphic encryption

Randomized reductions [Beaver-Feigenbaum90, Beaver-Feigenbaum-Killian-Rogaway97]

(Scatter, Recon) is RR from f to g if

A High-Level Framework

Problem #1: cloud operates all workers

Problem #2: Recon can be expensive

Solutions

Randomized reduction with $t = n$

- Univariate polynomials

- Multivariate polynomials

Outsource Recon

- Simple enough to be evaluated with single multiplication

Reduction for Univariate Polynomials

Scatter_q(x)

Set $n = 2q+1$

Sample $\alpha = (\alpha_1, \dots, \alpha_n)$ at random in F_q^n (all distinct)

Choose degree-2 *permutation* polynomial P_x such that $P_x(0) = x$

Set $s = (s_1, \dots, s_n) = (P_x(\alpha_1), \dots, P_x(\alpha_n))$

Output s and $st = \alpha$

Recon_q(st, y_1, \dots, y_n)

Interpolate Q through points $(\alpha_1, y_1), \dots, (\alpha_n, y_n)$

Output $Q(0)$

Reduction for Univariate Polynomials

Correctness

Secret sharing is “homomorphic”

Interpolation of $Q(p_x(\alpha_1)), \dots, Q(p_x(\alpha_n))$ at 0 results in $Q(p_x(0)) = Q(x)$

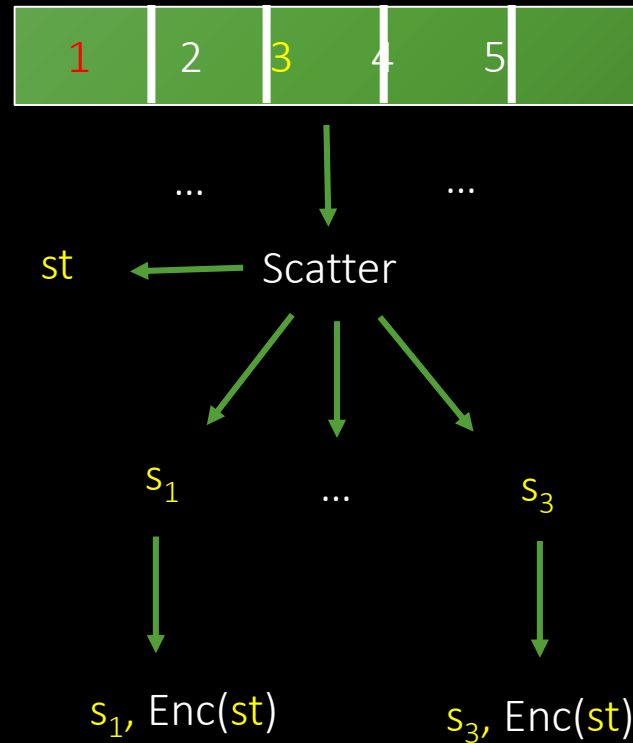

Security

Sharing polynomials are permutations

Evaluation points α_i are uniform

Shares are independent of secret

A General MR-Parallel HE Scheme
